Beep® DISINFECTANT SPRAY

BEEP® Disinfectant Spray is effective against a variety of bacteria, viruses and mold. It kills 99.9% of bacteria and mold in less than 60 seconds and can be used on glass, laminates, stainless steel, Perspex, glazed and unglazed tiles. Use BEEP® at home and at the office to disinfect work stations, garbage cans, door knobs, kitchen and bathroom surfaces.

BEEP IS EFFECTIVE AGAINST THE FOLLOWING GERMS:

H1N1	This flu virus, also known as "swine flu", can cause severe illness. Infected persons can contaminate objects (e.g. telephones) and spread the virus to others by coughing or sneezing.
Hepatitis A	This virus can cause liver disease. It can usually spread by ingestion of fecal matter, which can be transferred to food or other surfaces by: <ul style="list-style-type: none"> • A parent or caregiver (e.g. in a day nursery or home for the elderly) who does not wash their hands after changing a diaper. • An infected person who does not wash their hands after using the bathroom.
Serratia marcescens	These bacteria thrive in damp areas like the bathroom (especially in tile grout, showers, toilets and wash basins). They can infect wounds, respiratory and urinary tracts. 
Aspergillus niger	This mold, a component of mildew, is found in damp areas (e.g. bathroom stalls) and can cause respiratory problems. 
Escherichia coli (E. coli) Salmonella enteritidis Campylobacter jejuni Listeria monocytogenes	These bacteria are common causes of food poisoning. Eating undercooked meat/poultry or food that has been in contact with contaminated surfaces (e.g. counter tops) can cause illness. Food and surfaces can also be contaminated if an infected individual does not wash their hands after using the bathroom. 
Staphylococcus aureus Pseudomonas aeruginosa	These bacteria are especially problematic for those with compromised immune systems (e.g. individuals with AIDS, those undergoing chemotherapy, those with severe burns). The bacteria can be found on a variety of surfaces and can enter the body through breakages in the skin (e.g. a cut or scratch) and reactions can range from mild (a rash) to severe (pneumonia or sepsis).
